

MAP SHOWING POTASSIUM-ARGON AGES FROM THE GOODNEWS QUADRANGLE, ALASKA  
Frederic H. Wilson and James G. Smith

Presented here are 14 K/Ar ages on biotites and amphiboles from 10 plutons in the Goodnews quadrangle, Alaska. These samples were collected during the 1973-1975 field seasons by J. M. Hoare, W. L. Coonrad and F. H. Wilson.

Potassium was determined by flame photometry using lithium metaborate fusion. Potassium analyses were by J. H. Christie, Marcelyn Cramer, L. B. Schlocker and J. H. Tillman. Argon extraction and measurement was accomplished with the standard techniques of isotope dilution mass spectrometry as described by Dalrymple and Lanphere (1969). Argon extractions and measurements were done by the authors. The plus or minus value assigned to each age (Table 1) is an estimate of the standard deviation of analytical precision using the method of Cox and Dalrymple (1967), together with an estimate of uncertainty based on evaluation of the variations in the concentration of the <sup>38</sup>K tracer and the potassium measurements.

Sample and analytical data are listed in Table 1 and sample locations are plotted on the map. Outlines of plutons are from Hoare and Coonrad (1961) and the field notes of J. M. Hoare and W. L. Coonrad. The intention of this report is to present the K/Ar data. It is recommended that J. M. Hoare\* and W. L. Coonrad\*, who are currently preparing a series of MF maps for the Alaskan Mineral Resources Assessment Program, be consulted concerning interpretation and use of this data.
